

LedgerFlow

Frequently Asked Questions

Account Management

How do I create a LedgerFlow account?

Go to the LedgerFlow sign-up page and enter your business email, company name, and a password, or sign up using Google or Microsoft single sign-on. You'll receive a verification email; once confirmed, you can complete your company profile and start your free trial.

Can I change my subscription plan later?

Yes, you can upgrade or downgrade your plan at any time from Settings > Billing. Upgrades take effect immediately, while downgrades apply at the start of your next billing cycle so you keep access to your current features until then.

How do I reset a forgotten password?

Click "Forgot password" on the login screen and enter the email associated with your account. You'll receive a secure reset link valid for 30 minutes; if it expires, simply request a new one.

How do I close or delete my LedgerFlow account?

Account deletion requests can be submitted from Settings > Account > Close Account, or by contacting support directly. LedgerFlow retains your financial records for 90 days after closure to comply with accounting regulations, after which they are permanently deleted.

Invoicing

How do I create and send an invoice?

From the Invoices tab, click "New Invoice," select a client, add line items with quantities and rates, then choose to send it via email or generate a shareable payment link. You can also save any invoice as a reusable template for repeat clients.

Can I customize my invoice templates?

Yes, LedgerFlow lets you customize templates with your logo, brand colors, custom fields, and footer notes such as payment terms. Changes apply to new invoices only, so existing sent invoices remain unchanged.

What happens when an invoice is overdue?

LedgerFlow automatically flags overdue invoices on your dashboard and can send configurable reminder emails at intervals you set, such as 3, 7, and 14 days past due. You can also manually apply late fees if that's enabled in your invoice settings.

Can I set up recurring invoices?

Yes, you can mark any invoice as recurring and choose a frequency such as weekly, monthly, or annually. LedgerFlow will automatically generate and send the invoice on schedule until you pause or cancel the series.

Payments & Bank Sync

How does bank account syncing work?

LedgerFlow connects securely to your bank through an encrypted third-party aggregator, pulling in transactions daily so they can be automatically matched to invoices and expenses. You can connect multiple accounts and choose which ones sync to which ledgers.

What payment methods can my clients use to pay invoices?

Clients can pay via credit or debit card, ACH bank transfer, or supported digital wallets, depending on which payment processor you've connected. Available options appear automatically on the hosted payment page linked to each invoice.

Why isn't a bank transaction matching to an invoice automatically?

Auto-matching relies on comparing amounts, dates, and payer details, so mismatches often occur when a client pays a different amount or uses a different name than what's on file. You can manually match any unmatched transaction from the Bank Sync reconciliation screen.

Are there fees for processing payments?

Payment processing fees are set by the connected processor (such as Stripe or PayPal) rather than by LedgerFlow itself, and typically range from about 2.5% to 3% per transaction. Exact rates depend on your processor agreement and card type used.

Team & Permissions

How do I invite team members to my LedgerFlow account?

Go to Settings > Team, click "Invite Member," and enter their email address along with a role assignment. They'll receive an email invitation to create their own login linked to your company workspace.

What roles and permission levels are available?

LedgerFlow offers Admin, Accountant, and Viewer roles by default, controlling access to billing, invoice creation, and read-only reporting respectively. Custom roles with granular permissions are available on the Business and Enterprise plans.

Can I restrict a team member's access to specific clients or projects?

Yes, Admins can scope a user's access to specific clients or projects under Settings > Team > Permissions. This is useful for contractors or bookkeepers who should only see a subset of your financial data.

How do I remove a team member's access?

An Admin can deactivate a team member from Settings > Team by selecting their profile and choosing "Revoke Access." This immediately logs them out and prevents further sign-ins, while preserving their historical activity in the audit log.

Integrations (Stripe, PayPal, QuickBooks, Zapier)

How do I connect Stripe or PayPal to accept payments?

Navigate to Settings > Integrations, select Stripe or PayPal, and follow the prompt to log in and authorize the connection. Once connected, the payment option appears automatically on new invoices.

Can I sync LedgerFlow with QuickBooks?

Yes, the QuickBooks integration syncs invoices, payments, and chart-of-accounts data in both directions on a schedule you configure. Initial setup includes a mapping step so your LedgerFlow categories align correctly with existing QuickBooks accounts.

What can I automate using the Zapier integration?

The Zapier integration lets you trigger actions in thousands of other apps based on LedgerFlow events, such as creating a Slack notification when an invoice is paid or adding a new client to a CRM. You'll need a Zapier account, and available triggers and actions are listed in the LedgerFlow app on Zapier's platform.

What happens to my data if I disconnect an integration?

Disconnecting an integration stops future data syncing immediately, but any records already imported into LedgerFlow remain in your account. Reconnecting later will resume syncing without duplicating historical entries, provided the same account is used.

Data Security

How does LedgerFlow protect my financial data?

All data is encrypted in transit using TLS and at rest using AES-256 encryption, and access to production systems is restricted to authorized personnel under strict logging. LedgerFlow also undergoes regular third-party security audits and penetration testing.

Does LedgerFlow support two-factor authentication?

Yes, two-factor authentication (2FA) can be enabled from Settings > Security using an authenticator app or SMS verification. LedgerFlow strongly recommends enabling 2FA for all Admin-level accounts.

Who can access my company's financial data within LedgerFlow?

Only team members you've explicitly invited and assigned roles to can access your data, and LedgerFlow staff only access customer accounts with explicit permission for support purposes. All access, whether internal or external, is recorded in an audit trail visible to Admins.

Is LedgerFlow compliant with data protection regulations?

LedgerFlow is designed to comply with standards such as GDPR and SOC 2 Type II, covering how data is collected, stored, and processed. Compliance documentation and data processing agreements are available on request through your account representative.
