

LedgerFlow Troubleshooting Guide

Quick fixes for the most common issues reported by LedgerFlow users.

1. Invoice Not Sending

Symptom

You click "Send" on an invoice, but the client never receives it and the invoice stays marked as Draft or Failed.

Likely Causes

- The client's email address on the invoice is missing, misspelled, or malformed.
- LedgerFlow's outgoing mail service lost its connection to your email provider (common after a password change).
- The invoice is stuck in a queue because of a temporary server delay.

Fix

- Open the invoice and confirm the client email field is filled in correctly.
- Go to Settings > Email Integration and reconnect your email account if it shows a "Disconnected" badge.
- Use the "Resend" button rather than creating a duplicate invoice; wait a few minutes, since queued sends usually clear on their own.
- If the invoice still shows Failed after reconnecting, delete it and recreate it from the same client record.

2. Bank Sync Failing

Symptom

The bank connection shows an error icon, and new transactions stop appearing in your ledger.

Likely Causes

- Your bank requires you to re-authenticate after a set period, and that step was never completed.
- The bank changed its login flow or added a new security prompt that LedgerFlow doesn't recognize yet.
- The linked account was closed, renamed, or has multi-factor login that timed out mid-sync.

Fix

- Go to Banking > Connected Accounts and click "Reconnect" next to the affected account.
- Complete any new verification steps your bank presents (security questions, one-time codes) fully before closing the window.
- If reconnecting fails repeatedly, remove the account and re-add it from scratch using Banking > Add Account.
- For accounts that were closed or renamed at the bank, unlink the old connection and link the new account details instead.

3. Payment Not Showing as Received

Symptom

A client says they've paid, but the invoice in LedgerFlow still shows as Unpaid or Overdue.

Likely Causes

- The payment was made outside LedgerFlow's connected payment methods (e.g., a direct bank transfer) and needs manual matching.
- Bank sync is delayed, so the transaction hasn't been imported yet (see Issue 2).
- The payment was applied to the wrong invoice or the wrong client record.

Fix

- Check Banking > Unmatched Transactions for a deposit that matches the amount and date, and manually match it to the invoice.
- If the transaction hasn't arrived yet, confirm the bank sync is healthy, then wait for the next automatic sync cycle.
- Search all invoices for the payment amount to rule out a misapplied payment, then move it to the correct invoice.
- As a last resort, mark the invoice as "Paid Manually" and attach a note with the payment reference for your records.

4. Client Not Receiving Invoice Emails

Symptom

LedgerFlow shows the invoice as Sent, but the client says nothing arrived, not even in spam.

Likely Causes

- The email landed in the client's spam or promotions folder without being flagged as missing.
- The client's mail server is blocking messages from LedgerFlow's sending domain.
- A typo in the client's email address is close enough to a real address that it didn't bounce, but still didn't reach them.

Fix

- Ask the client to check spam, junk, and promotions folders and to add your invoicing address to their contacts.
- Resend the invoice with "Send me a copy" enabled so you can confirm delivery on your end.
- Double-check the client email field character by character, especially domain endings like .co vs .com.
- If delivery keeps failing for one client, share the invoice link directly instead of relying on email delivery.

5. Recurring Invoice Not Generating

Symptom

A recurring invoice schedule exists, but no new invoice was created on the expected date.

Likely Causes

- The recurrence schedule was paused or ended and no one noticed.
- The end date on the recurrence was set earlier than intended when it was created.
- The template invoice used for recurrence was deleted or archived.

Fix

- Go to Invoices > Recurring and confirm the schedule status reads Active, not Paused.
- Open the recurrence settings and check the end date; extend it if it stopped earlier than planned.
- Confirm the source template invoice still exists and hasn't been archived or deleted.
- If the schedule looks correct but still skipped a cycle, manually trigger "Generate Now" and verify future dates advance normally.

6. Login / 2FA Issues

Symptom

You can't log in, or you're stuck at the two-factor authentication step with no valid code.

Likely Causes

- The authenticator app's time is out of sync, producing codes that no longer match.
- You lost access to the phone or app originally used to set up 2FA.
- Too many failed attempts temporarily locked the account for security.

Fix

- Make sure your phone's date and time are set to update automatically, then try a freshly generated code.
- Use one of your saved backup codes from account setup to log in, then re-enroll 2FA on a working device.
- If locked out, wait for the cooldown period shown on the login screen before trying again.
- If none of these work, use the "Can't access your authenticator?" link on the login page to start identity verification with support.

Still stuck? Contact LedgerFlow Support with your account email and a screenshot of the issue for faster help.
